

## Product Recommendation 190808

Issue Date:	<b>8<sup>th</sup> August 2019</b>
Specification	<b>Tiling over Wet-seal Waterproofing Membranes</b>
Issued to:	<b>General</b>

### **Background**

Bostik manufacture a number of cementitious tile adhesives. We have tested the adhesion of a selection of these to Wet-seal's membranes, Enviro-coat DS 420, and Enviro-coat IS 520.

The results of the testing has resulted in the following recommendations:

### **Recommendations**

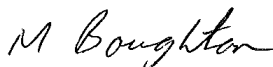

Based on the testing conducted, the best adhesives for use in bonding directly to these membranes are Bostik Asaflex, and Conflex. This would hold while the products tested remain unchanged. Should either the membrane, or adhesives, be altered then retesting may be required.

This advice is intended to be general only. In addition, it is assumed that the tiles and / or materials tested were representative of the materials to be installed. Contact Bostik for advice before work commences if the nature of the tile changes, or if intending to install in unusual situations.

If more information is required, please contact the Bostik Technical Services Department.

All information, recommendations and suggestions are based on the test conducted on each product(s). The test results are based on standard laboratory conditions and may not replicate the actual site conditions and other unforeseen variables that can arise during and after the application. It is important that the customer must perform additional test to ensure suitability of the product. This document must not be reproduced or provided to other parties without written approval from Technical Department.
